

GameChange Solar adds 6.4 GW of production lines in China

June 13 (Renewables Now) - US-based solar racking manufacturer GameChange Solar announced on Wednesday the addition of 6.4 GW of tracker and fixed tilt production capacity in China.

The company said in a statement it will use the new production lines to pursue growth into international markets such as China, the Middle East, Europe, Australia and Africa.

Chief commercial officer Derick Botha commented that the use of the lower cost manufacturing base in China allows the company to sell its products at value prices that are "below all current market offerings."

With the new additions, GameChange's total annual manufacturing capacity around the world exceeds 15 GW.

In March, the company said it was launching a global expansion, with an initial focus on Latin America.
