

# GameChange Solar forecasts more than 20 GW of various system sales over 3 years

December 4 (Renewables Now) - US-based solar racking manufacturer GameChange Solar said Tuesday that sales of the Genius Tracker system with 2 portrait (2P) configuration are expected to top 3 GW worldwide over the next three years.

Based on customer indications, the company also forecasts sales of the Genius Tracker system with 1 portrait configuration to reach 12 GW in addition to selling 5 GW of fixed tilt systems in the period.

"The 2P configuration for a single axis tracker is well poised to optimize certain design requirements related to bifacial modules such as ensuring no structure is behind any modules and mounting the modules on their long side," said Scott Van Pelt, vice president of engineering at GameChange Solar.
