GameChange Solar has added over 4 GW of dedicated I-beam post manufacturing capacity this year.

The I-beam fabrication and galvanizing capacity – added in Louisiana, Michigan and Indiana – is capable of making posts for both fixed-tilt and tracker systems. These additions, combined with the company's extensive roll forming post capacity, brings total capacity to over 10 GW for posts and 9 GW for tracker and fixed-tilt systems in the U.S. GameChange Solar claims to have the

largest manufacturing base of any U.S. solar structure and tracker system provider.

"This addition of 4 GW of dedicated I-beam post manufacturing allows GameChange Solar to meet increasing demands for all our products, both fixed-tilt and tracker," comments Derick Botha, chief commercial at GameChange Solar. "Having U.S. capacity not only ensures rapid delivery of products to customers but also protects against the uncertainties and price fluctuations resulting from tariffs."
