

The U.S. Environmental Protection Agency (EPA) recognizes the overall environmental benefit of siting renewable energy projects on contaminated properties. Through the [RE-Powering America's Land Initiative](#), EPA is encouraging renewable energy development on current and formerly contaminated lands, landfills, and mine sites when such development is aligned with the community's vision for the site.

Using publicly available information, RE-Powering maintains a list of completed renewable energy installations on contaminated sites and landfills. To date, the RE-Powering Initiative has identified 190 renewable energy installations on 181 contaminated lands, landfills, and mine sites¹, with a cumulative installed capacity of just over 1,172 megawatts (MW) and consistent growth in total installations since the inception of the RE-Powering Initiative. Approximately 60% of these installations are large-scale systems with a project capacity of 1 MW or more, either exporting energy onto the utility grid, offsetting onsite energy demands, or powering cleanup. This document provides summary statistics of known installations and discusses emerging trends.

In addition to the completed sites listed here, EPA is tracking more than 100 renewable energy projects on contaminated or disturbed properties in various stages of planning, approval, or construction. These include a 1.1-MW solar project under construction on a Meriden, CT landfill; a 2-MW solar project under construction on a landfill in Lake Worth, FL; and a 7.75-MW solar array ready for construction on a former oil refinery and fertilizer manufacturing site in Olean, NY. In addition, EPA is aware of more than 50 other potential renewable energy projects on contaminated sites, primarily landfills, which have been suggested at town council or public meetings.

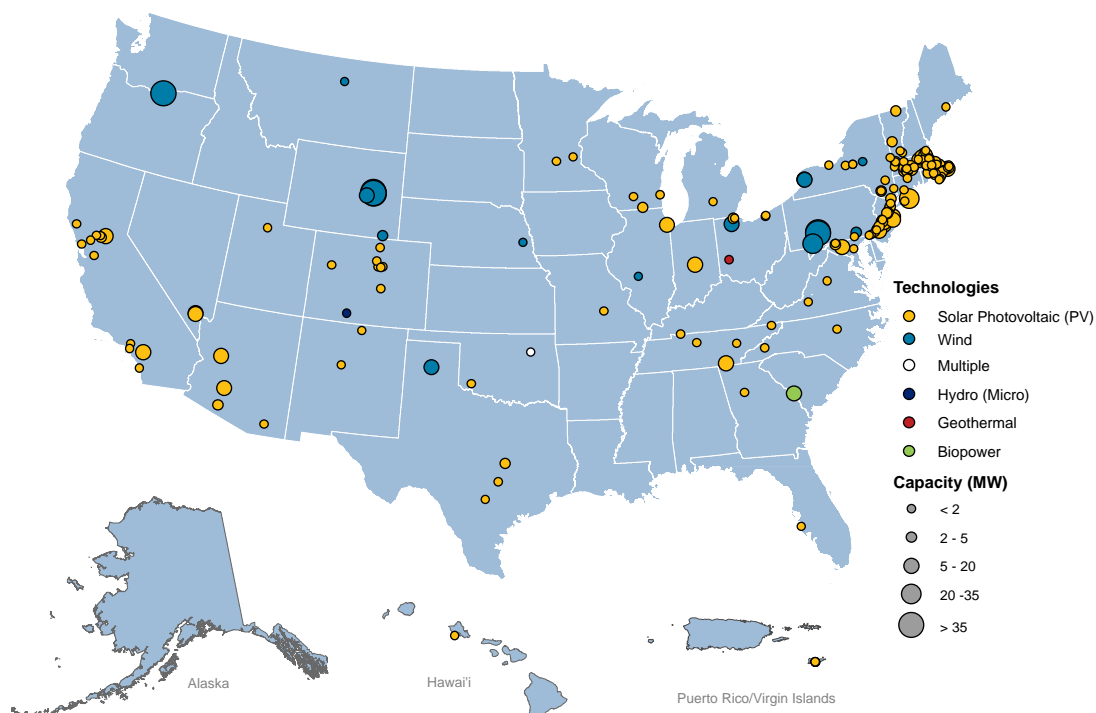

**RE-Powering America's
Land Initiative**

190 Renewable Energy Projects, Over 1.1 Gigawatt Installed Capacity

This map is for informational purposes only. The information was gathered from public announcements of renewable energy projects in the form of company press releases, news releases, and, in some cases, conversations with the parties involved. This map may not be a comprehensive representation of all completed renewable energy projects on contaminated lands. To provide information on additional projects, please email cleanenergy@epa.gov.

October 2016

¹ In this document, *installation* and *project* refer to a single renewable energy technology installation, while *site* and *location* refer to a single contaminated property. A *site* or *location* may have more than one *installation* or *project*. For example, the former Dave Johnston Mine (one *site*) has three separate wind *installations*. Multiple installation details can be seen in the tracking spreadsheet at the end of this document.

National Deployment

RE-Powering has identified installations of renewable energy on contaminated lands, landfills, and mine sites in 38 states and territories. The locations of these installations reflect evolving trends generally linked to available renewable energy resource as well as incentives or policies such as Renewable Portfolio Standards (RPSs), tax exemptions, net metering laws, and others. Policy data in this section are from the [Database for State Incentives for Renewables and Efficiency](#) (DSIRE), a comprehensive database managed by the North Carolina Clean Energy Technology Center and funded by the U.S. Department of Energy. DSIRE compiles renewable energy and energy efficiency incentives and policies enacted by the federal government, state governments, U.S. territories, local governments, and large utilities. The DSIRE website allows users to search policies [by state](#) and provides quarterly [summary maps](#).

INSTALLATIONS BY STATE OR TERRITORY²

State	# Installations	Installed Capacity (MW)	State Renewable Portfolio Standard ³	Solar Set-Aside Policy ⁴	Solar Multiplier Policy ⁵	Distributed Generation Requirement ⁶
MA	64	142.7	✓	✓

TOTAL	190	1,172.9				

² Table includes states with multiple installations plus the state with the largest single installation. Policy information from DSIRE (www.dsireusa.org). Accessed Oct. 14, 2016.

³ A renewable portfolio standard (RPS) requires utilities to use or procure a certain percentage of total generation from renewable sources.

⁴ A solar set-aside requires a certain percentage of the state's electricity be generated from solar resources. Some states call them "solar carve-outs."

⁵ A solar multiplier gives additional credit for solar projects that contribute toward meeting RPS requirements.

⁶ A distributed generation requirement obliges a utility to procure a certain percentage of electricity from renewable, customer-sited sources.

⁷ Texas has already achieved its 2025 RPS goal. The state also had a voluntary non-wind generation goal that expired in 2015 and has been exceeded.

⁸ Texas has a non-wind multiplier policy, which includes solar, but is not *specific* to solar. The non-wind multiplier is active through 2019, when the state's REC trading program is currently set to expire.

⁹ Virginia has a voluntary renewable portfolio goal that provides an [enhanced rate of return](#) for renewable generation from approved projects.

¹⁰ Oklahoma's RPS is a goal, not a requirement.

¹¹ Minnesota's solar carve-out is divided by utility. The overall carve-out is 1.5% for solar for public utilities by the end of 2020, 10% of which must come from solar PV systems with capacity of 20 kW or more. Xcel Energy, however, is required to have at least 25% of retail electricity sales generated by wind energy or solar energy systems by 2020, with solar limited to no more than 1% of this additional requirement.

¹² Oregon's RPS includes a goal that, by 2025, at least 8% of the state's electrical load comes from small-scale, community renewable energy installations with capacities of 20 MW or less. The RPS also includes a multiplier for PV systems with a capacity of 500 kW to 5 MW installed prior to January 1, 2016.

¹³ For purposes of this report, RoUS (Rest of US) indicates other states or territories with renewable energy on contaminated lands: Florida, Georgia, Hawai'i, Indiana, Kentucky, Maine, Michigan, Missouri, Montana, Nebraska, Rhode Island, South Carolina, Utah, and the U.S. Virgin Islands.

RE on CL EPA Evaluation Examines RE-Powering Initiative

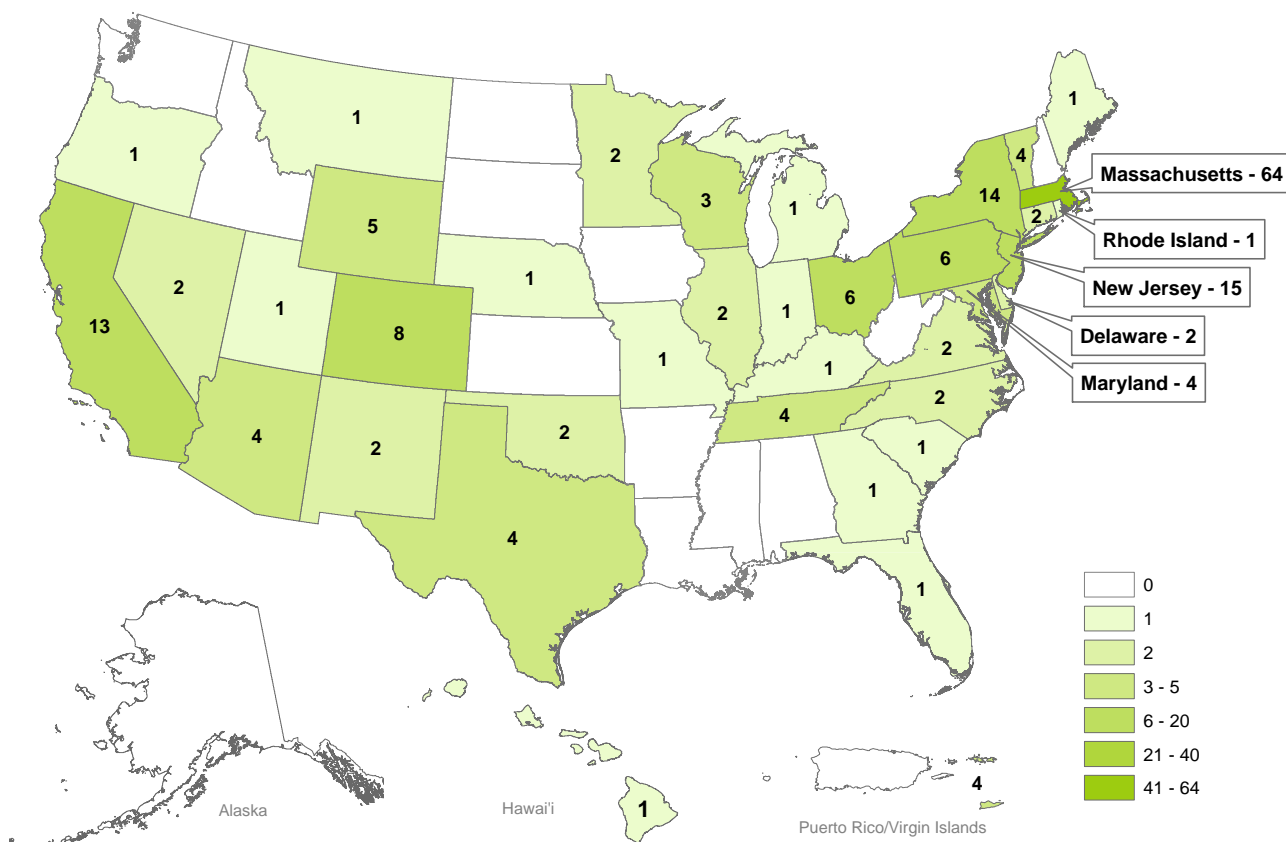

EPA recently compiled the results of the second phase of its RE-Powering Initiative evaluation. The evaluation proceeded in two steps. First, an initial evaluation scoping assessment that explored data availability and potential evaluation questions was conducted. From that assessment, EPA identified several aspects of the Initiative for additional focus; the second phase was launched in June 2015.

The evaluation sought to address questions about RE-Powering's role in moving the RE on CL market, the usefulness of the EPA/NREL feasibility studies, and the costs (or savings) associated with RE on CL. EPA also developed a process "roadmap" for successful RE on CL development by compiling perspectives offered by various stakeholders. Fundamentally, the evaluation asked how RE-Powering could more effectively encourage RE on CL installations.

EPA executed the evaluation through stakeholder interviews; a comprehensive literature review; and a review of the RE-Powering Tracking Matrix, websites, tools, case studies, reports, and newsletters. EPA also developed a timeline of program and market development, based on interviews, literature review, and data; created a process map based on developer interviews and EPA documents; and identified cost components of solar and wind projects.

While RE-Powering is thought to have been helpful in moving the market forward, the evaluation identified additional barriers that still needed to be overcome. Full details of the evaluation and its findings are available on the [EPA website](#).

38 States have Renewable Energy Projects on Contaminated Lands

This map is for informational purposes only. The information was gathered from public announcements of renewable energy projects in the form of company press releases, news releases, and, in some cases, conversations with the parties involved. This map may not be a comprehensive representation of all completed renewable energy projects on contaminated lands. To provide information on additional projects, please email cleanenergy@epa.gov.

October 2016

RE on CL Offers a Range of Economic Benefits

RE on CL provides a number of [benefits](#) to the communities within which the sites are built, from making productive use of defunct land to offering economic benefits to municipalities. Such economic benefits include lease payments, taxes or Payments in Lieu of Taxes (PILOT), jobs, and lower energy costs. Some examples include:

Fort Detrick Solar – This 18.6-MW solar installation in Maryland is expected to provide [nearly \\$3 million in cost avoidance](#) over the duration of the 25-year PPA between the U.S. Army and developer Ameresco. The site is estimated to have saved the Army [\\$136,000](#) in just the first two and half months of operation.

Nellis Solar Array II – This 15-MW solar installation at Nellis Air Force Base in Nevada created approximately 150 jobs for site installation and NV Energy upgrades. In addition, the new substation and distribution lines added for the solar help provide [system redundancy and protect the base](#) against power vulnerabilities. The solar installation is expected to provide [emissions reductions of 27,000 tons](#) of carbon dioxide annually.

Weston Landfill Solar – The town of Weston, MA, will receive [one net metering credit](#) for each kilowatt-hour of electricity generated by a 2.27-MW solar array on the town landfill over the course of a 20-year Power Purchase Agreement (PPA) with utility Eversource (Nstar). The credits will be applied to the town's electric bill, thereby reducing overall electricity costs.

Groton Landfill Solar – This 2.3-MW solar installation on a landfill in Groton, MA, [will provide 25%](#) of Groton Electric Light Department's required electricity during the middle of the day in the spring and fall.

San Bernardino County Landfill Set to Shine with Solar

A former landfill in Ontario, California, is on track to become a solar field. The County of San Bernardino's Milliken Sanitary Landfill is under construction to house a 3-MW solar installation on 14 acres. The installation will connect to an on-site substation operated by the California Independent System Operator, known as CAISO. PV Navigator (PVN) a landfill-specific solar power development group, is developing the site. The company released an [RFP](#) for an Engineering, Procurement, Construction—or EPC—contractor for the solar. A small, local business was selected, Mangan Renewables, LLC. The company has mostly installed solar arrays on Costco buildings, and this is their first solar on landfill installation.

The [196-acre Milliken site](#) operated as a Class III landfill from 1956 to 1999, and the site was closed in three phases. The landfill cap was completed in 2005 and covers an estimated in-place volume of 25 million cubic yards of solid waste. The project uses a GameChange Solar's round tub racking, which allows any drainage to have little to no impact. The solar installation is expected to employ 50-60 people at the peak of construction and is using local labor. PVN has secured a 20-year [Power Purchase Agreement](#) (PPA) with Southern California Edison (SCE), under which 100 percent of the electricity from the solar system will be sold directly to SCE's grid.

PVN expects to complete the Milliken installation around the end of 2016. This facility will help California achieve the state RPS goals set by the legislature and governor. This project can be used as a template for other solar projects within the state to be sited on closed landfills.

EPA and White House Host Clean Energy Summit, Kick Off Solar on Landfill Project

EPA recently partnered with the White House to convene a [Clean Energy Savings for All Summit](#) in Spartanburg, S.C. The summit convened local officials, advocates, community organizations, and the public to discuss efforts to reduce air pollution, deploy clean energy and energy efficiency, and build an inclusive clean energy economy that engages low-income communities.

The event included a kickoff ceremony for a solar installation to be built on Spartanburg's now-capped Arkwright landfill, a designated [Superfund](#) site.

The South Carolina summit was the first in a series planned across the country.

Racking and tubs installed on the Milliken Landfill site.

Landfill in Wisconsin Provides Clean Energy

The state of Wisconsin can now boast that its largest solar installation is on a former landfill site. In June 2016, a 2.3-MW solar installation went live on 17 acres of the former Beloit Coal Ash Landfill in Beloit, Wisconsin. The site is owned by Alliant Energy and was once used for disposal of coal ash from a now-closed coal plant located adjacent to the landfill. The company collaborated with the Wisconsin Department of Natural Resources in enabling the location to be used as a solar facility.

Hanwha Q Cells developed the solar installation and has executed a 10-year PPA with Alliant that includes the option for Alliant to purchase the facility at the end of the PPA term. The installation includes more than 7,700 solar panels and produces [enough electricity](#) to power 500 homes.

The project was developed as part of a consent decree between EPA, Sierra Club, and Wisconsin Power and Light (WP&L), which Alliant owns. The terms of the agreement include a requirement that WP&L and other parties to pay \$8.5 million to fund a series of environmental projects over the next five years. The projects include a \$5 million investment in solar power.

Air Force and Army Power Up with Solar on Contaminated Land

The U.S. Department of Defense (DoD) recently unveiled two new renewable energy projects on contaminated sites. The first, Nellis Solar Array II, is a 15-MW solar installation located on 102 acres of a closed landfill at Nellis Air Force Base (AFB) in Nevada. As its name implies, Nellis Solar Array II is the second solar installation on the Nellis AFB; the first is a 13.2-MW installation completed in 2007. The two installations combined provide 42 percent of the base's electricity needs and represent the largest solar installation at a DoD facility.

The \$50 million installation is connected to a new NV Energy substation on the base. The installation was developed by [SunPower](#) and created 150 construction jobs. The array is now is operated by NV Energy under a 31-year lease term with DoD. Nellis Solar Array II is the first large-scale solar resource owned by NV Energy.

The second DoD installation completed recently is an 18.6-MW solar field on a former medical command site at the Army's [Fort Detrick](#) in Maryland. The area in which the solar is installed is a [designated Superfund site](#), with trichloroethylene and perchloroethylene the major chemical constituents detected in the groundwater. The site was established as a proving ground in the Army's Biological Warfare program, and was later used as a disposal area for chemical, biological, and radiological material and, until 1970, for biological experimentation.

From left to right: Sen. Harry Reid; Paul Caudill, NV Energy CEO; Miranda A.A. Ballentine, Assistant Secretary of the Air Force for Installations, Environment and Energy; Tom Werner, SunPower Corp. CEO; and Col. Richard Boutwell, 99th Air Base Wing commander, at the Feb. 2016 dedication for the Nellis Solar Array II. U.S. Air Force photo by Airman 1st Class Kevin Tanenbaum.

The 67-acre Fort Detrick solar field was developed by Ameresco, Inc. and comprises 69,994 solar panels. The installation connects to Army-owned transmission lines and powers operations at the base through a 25-year PPA with Ameresco.

Inside the Numbers

Based on current trends, just over two-thirds of the identified renewable energy systems sell power back to the grid as wholesale electricity, while a subset provides energy for onsite use. Systems range from utility-scale systems, like the 2.94-MW solar installation at the Central Texas Veterans' Landfill, to smaller projects like the 0.4-MW solar installation on Hutchinson Landfill in Minnesota.

RE-Powering capitalizes on the opportunity to address contamination and support renewable energy implementation to achieve the associated economic and environmental benefits. Installations to date demonstrate the viability of projects across all EPA and state remediation programs, from powering industrial facilities at sites subject to [RCRA corrective action](#) to offsetting the energy demands at [federal facilities](#) with ongoing cleanup activities to repurposing [brownfield](#) and [Superfund](#) sites.

Overview	
Total # of sites	181
Total # of installations	190
Total installed capacity (MW)	1,172
Total # of states represented	38 ¹⁴
Max individual installation size (MW)	118.5
Min individual installation size (MW)	<.001

Installation by Site Ownership Type		
	# Installations	Installed Capacity (MW)
Private	58	691.3
Municipal	86	174.0
Federal	18	128.7
Unknown	11	85.1
Public/Private ¹⁷	1	75.0
Other	11	17.2

Public	1	0.5
Federal/Municipal	1	0.2
Foundation	1	0.0
Total	190	1,172.9

Installations by Renewable Technology		
	# Installations	Installed Capacity (MW)
Wind	23	634.2
Solar PV	163	518.7
Biomass	1	20.0
Hydro	1	<0.1
Geothermal ¹⁸	2	<0.1
Total	190	1,172.9

Number of Installations by Site Type ¹⁵	
Solar and wind projects on landfills/landfill buffer	111
Renewable energy projects on brownfield sites	36
Renewable energy projects on Superfund sites ¹⁶	28
Renewable energy projects on current/former federal facilities and contaminated properties	20
Renewable energy projects on RCRA corrective action sites	13
Renewable energy projects on mine sites	10

Installations by Energy Use		
	# Installations	Installed Capacity (MW)
Wholesale Electricity	129	1052.8
Onsite Use - General	26	100.2
Onsite Use - Green Remediation ¹⁹	24	7.8
Rooftop	4	4.7
Local Use	1	3.2
Unknown	3	2.7
Community Owned/Subscription	2	1.0
Onsite Use - Training	1	0.5
Total	190	1,172.9

¹⁴ Includes U.S. Virgin Islands.

¹⁵ Some installations can be considered multiple "site types." For example, a Superfund site on a federal facility would be counted both as a Superfund site and as a federal facility for the purposes of this table; however, sites considered to be multiple site types are counted only once when calculating the total number of sites.

¹⁶ Includes sites subject to the National Priorities List (NPL), non-NPL sites, and sites subject to removal action under Superfund.

¹⁷ This is the Highland North Wind Project in the townships of Adams and Summerhill, PA. The turbines are located on mixed use land, which Everpower notes is held by both [public and private landowners](#).

¹⁸ One geothermal project, the Guthrie Green project in Tulsa, OK, uses a small solar array to power the geothermal heat pump.

¹⁹ Green remediation is the practice of considering all environmental effects of remedy implementation and incorporating options to minimize the environmental footprints of cleanup actions. One such practice is using renewable energy systems to power remediation activities or off-set the energy needs associated with cleanup efforts. Projects identified as [On-site Green Remediation](#) include all known projects which currently use or have previously used renewable energy for remediation purposes. This figure may include projects that have ceased operations since being added to the tracking matrix. Capacity includes a 4.5-MW system used to offset groundwater remediation systems at Massachusetts Military Reservation.

Total Projects by Technology

Total Capacity by Technology

Continuing Growth

With the exception of one 100-MW wind installation on landfill buffer in Oregon (Columbia Ridge), only 19 projects with a total capacity of 143 MW were installed on contaminated sites through 2007. Of these, many were onsite or green remediation projects, and only four were individually larger than 1 MW. Beginning in 2008, RE-Powering has seen a marked upward trend in terms of the number of new renewable energy projects developed on contaminated lands, the amount of installed capacity produced by these projects, and the number connected to the wholesale electricity grid. These trends demonstrate that communities, developers, and site owners are embracing this sustainable land development strategy.

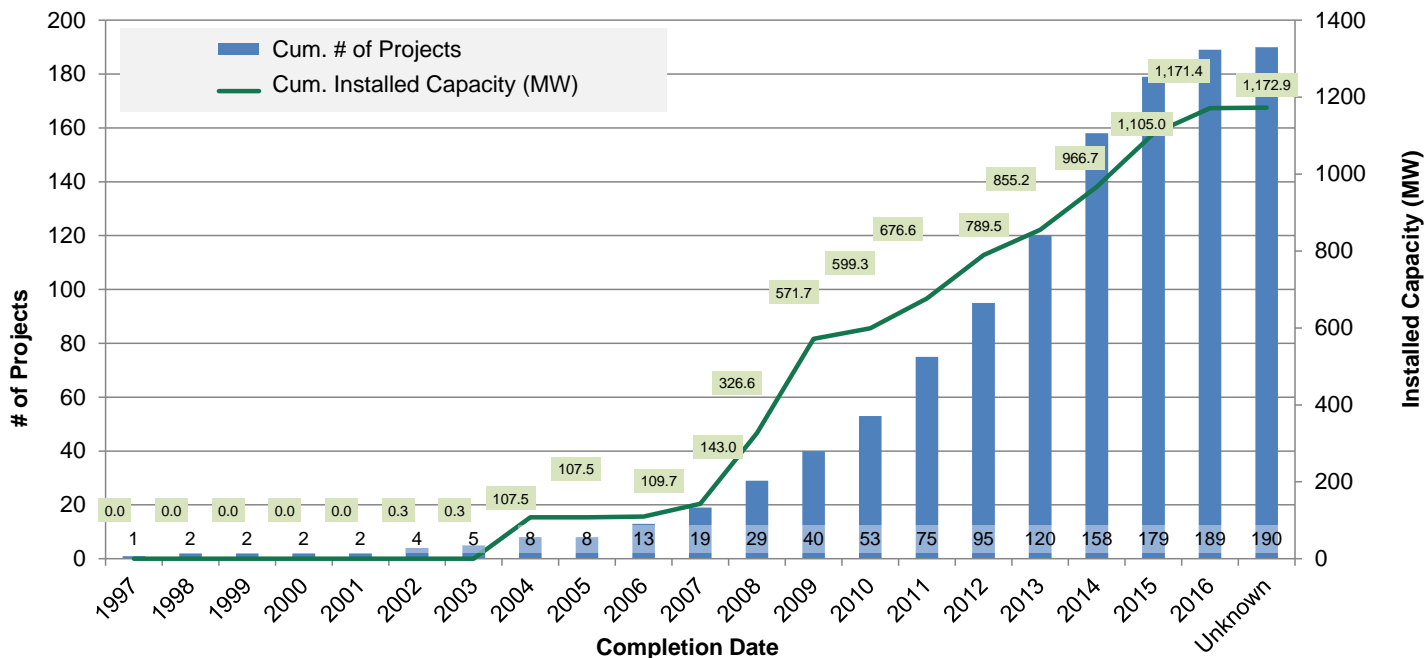

The range in project sizes reflects market conditions and trends, available acreage, electricity demands, and other variables. Medium- to large-scale installations (1-10 MW) make up almost half of the total number of installed projects to date, while larger systems (10+ MW) comprise about 78% of total installed capacity on contaminated lands.

Of identified projects, 86% are solar PV projects developed on contaminated lands, landfills, and mine sites, while 54% of installed capacity is provided by wind systems. The dominance in wind capacity is explained in part by a few very large wind projects, notably the Casselman Wind Power Project in Somerset County, Pennsylvania (35 MW); Steel Winds in Bethlehem, New York, (35 MW); the wind farm at Columbia Ridge Landfill, Oregon (100 MW); Highland Wind (62.5 MW) and Highland North Wind (75 MW) in Cambria County, Pennsylvania; and the three wind farms at the former Dave Johnston Mine in Glenrock, Wyoming (276 MW). Wind tends to be used more often on vast tracts of contaminated land, such as mine sites, while solar PV is the dominant technology at smaller tracts such as municipal solid waste (MSW) landfills.

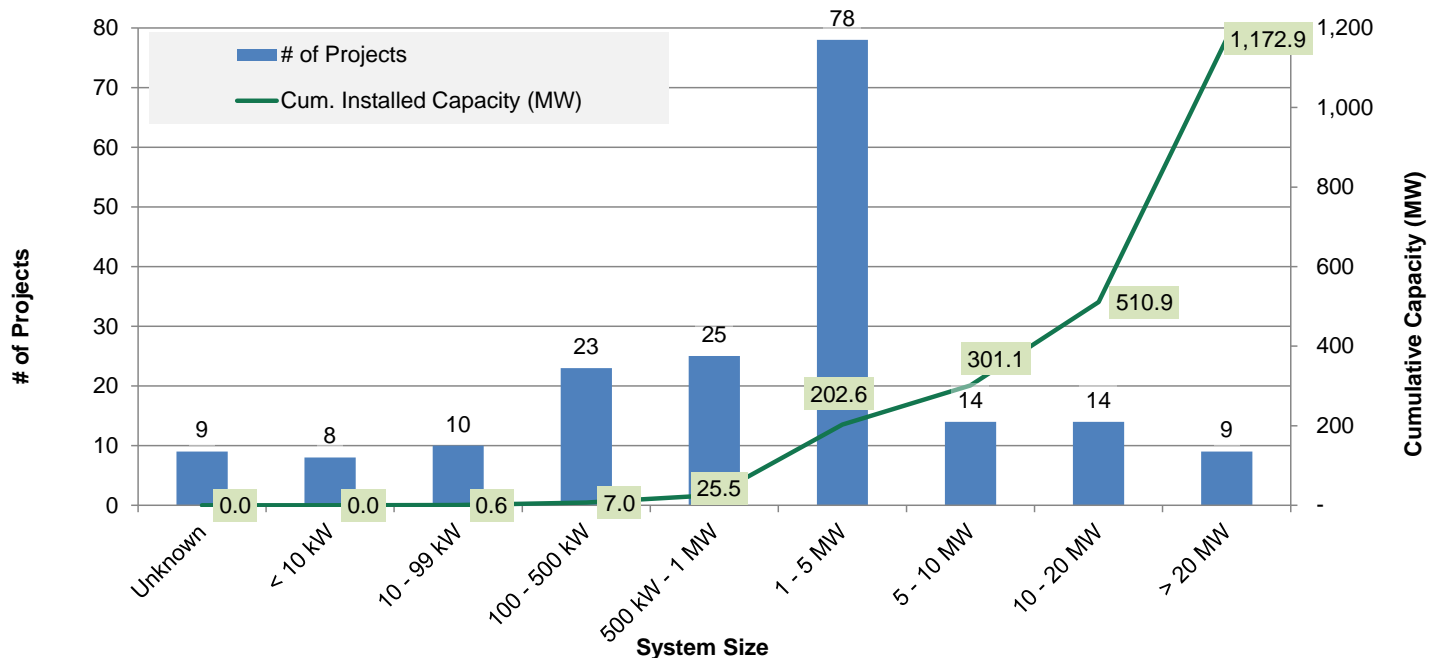

The RE-Powering strategy creates new markets for potentially contaminated lands, while supporting a sustainable land development strategy for renewable energy. One continuing trend is the reuse of former landfills as large solar PV developments. To date, EPA is aware of 105 former landfills²⁰ that have been returned to productive use as solar projects. Of these, at least 86 (82%) were completed between 2012 and 2016. Many more are currently being planned or permitted, or are under construction. For more information regarding considerations specific to solar projects on landfills, see RE-Powering's [Best Practices for Siting Solar Photovoltaics on Municipal Solid Waste Landfills](#).

²⁰ This includes landfills accepting MSW, construction waste, and industrial waste, as well as landfill buffer areas.

Annual Growth of Completed Installations and Installed Capacity^{21, 22}

Range of System Sizes of Completed Installations

²¹ Note that the growth curve for both the number of sites and cumulative installed capacity differs from previous versions of the Project Tracking Matrix, as the RE-Powering team learns about additional renewable energy projects installed on contaminated lands in previous years.

²² The "Unknown" installation is a 1.5 MW solar installation constructed by Honeywell Corporation as part of the Onondaga Lake cleanup project in Onondaga, NY. The bulk of the cleanup took place in 2010, but the exact completion date of the solar installation is unknown.

Annual Growth in Solar Installations on Landfill/Landfill Buffer

RE-Powering America's Land Initiative: Project Tracking Matrix

October 2016

Through the RE-Powering America's Land Initiative, the EPA encourages renewable energy development on potentially contaminated land when aligned with the community's vision for the site. This list tracks completed projects where renewable energy systems have been installed on potentially contaminated lands, landfills, or mine sites. Project capacity data reflect total system capacity, which may be installed in whole or in part on potentially contaminated lands, landfills, or mine sites. For systems with an installed capacity less than 10 kW, the capacity is shown as 0.00. Where information was not found for a given site, it is noted as "Unknown" or with a "-" for numerical values. This information is sorted by state and then by site/project name. Installations newly added for October 2016 are highlighted in orange.

This resource is for informational purposes only. The information in this list was gathered from public announcements of renewable energy projects in the form of company press releases, news releases, and, in some cases, conversations with the parties involved. It may not be a comprehensive list of all projects completed on contaminated land. Projects on this list include ground-mounted utility-scale systems, rooftop systems, and systems used for onsite power, including to power cleanup activities. To provide information on additional projects, please email cleanenergy@epa.gov.

RE-Powering America's Land Initiative: Project Tracking Matrix

October 2016

Through the RE-Powering America's Land Initiative, the EPA encourages renewable energy development on potentially contaminated land when aligned with the community's vision for the site. This list tracks completed projects where renewable energy systems have been installed on potentially contaminated lands, landfills, or mine sites. Project capacity data reflect total system capacity, which may be installed in whole or in part on potentially contaminated lands, landfills, or mine sites. For systems with an installed capacity less than 10 kW, the capacity is shown as 0.00. Where information was not found for a given site, it is noted as "Unknown" or with a "-" for numerical values. This information is sorted by state and then by site/project name. Installations newly added for October 2016 are highlighted in orange.

This resource is for informational purposes only. The information in this list was gathered from public announcements of renewable energy projects in the form of company press releases, news releases, and, in some cases, conversations with the parties involved. It may not be a comprehensive list of all projects completed on contaminated land. Projects on this list include ground-mounted utility-scale systems, rooftop systems, and systems used for onsite power, including to power cleanup activities. To provide information on additional projects, please email cleanenergy@epa.gov.

RE-Powering America's Land Initiative: Project Tracking Matrix

October 2016

Through the RE-Powering America's Land Initiative, the EPA encourages renewable energy development on potentially contaminated land when aligned with the community's vision for the site. This list tracks completed projects where renewable energy systems have been installed on potentially contaminated lands, landfills, or mine sites. Project capacity data reflect total system capacity, which may be installed in whole or in part on potentially contaminated lands, landfills, or mine sites. For systems with an installed capacity less than 10 kW, the capacity is shown as 0.00. Where information was not found for a given site, it is noted as "Unknown" or with a "-" for numerical values. This information is sorted by state and then by site/project name. Installations newly added for October 2016 are highlighted in orange.

This resource is for informational purposes only. The information in this list was gathered from public announcements of renewable energy projects in the form of company press releases, news releases, and, in some cases, conversations with the parties involved. It may not be a comprehensive list of all projects completed on contaminated land. Projects on this list include ground-mounted utility-scale systems, rooftop systems, and systems used for onsite power, including to power cleanup activities. To provide information on additional projects, please email cleanenergy@epa.gov.
